I want to use the above data as a source for creating a new data frame with column names in row names. I have tried to use the split function, while I receive the error "non-numeric argument to binary operator". My data was divided with different combination of the following: `val[val==""] = n[val[val==""]] val[val=="yes"] = n[val[val=="yes"]] val[val=="no"] = n[val[val=="no"]]` If there is any other way to get a new data frame with column names that A: It is trying to do the calculation 'yes' * (1 + 1/N) which results in non-numerical. You may be able to use a vectorized operation instead: `val[val=="yes"] (1)`, and the kinetic center of mass motion is quantized in units of $\sqrt{k_B T_0}$. Thermal fluctuations with characteristic inverse temperature $\beta_0 = 1/(k_B T_0)$ can also be represented by a ϕ_0 -operator [Phillips1977]. In Eq. (Hamiltonian), we have assumed that the rf drive is able to address all spins within the sample independently of their positions with respect to the main magnetic field. In a realistic sample, however, an rf wave induces a magnetic field at non-zero $\mathbf{r}$ that makes the individual spins in a position differentially precess, and consequently not all spins are addressed by the rf wave equally. [1]: We use the normalization $\langle S_\alpha^{(j)} S_\beta^{(k)} \rangle = \delta_{\alpha\beta} \delta_{jk}$, and $\langle T_0^2 \rangle = 1/4$ in a ^{25}MgO sample with ^{13}C nuclear spin $I=5/2$.
