CT-scan is a type of X-ray. It is
used to see into your body to
help diagnose illnesses. It is often
done on an outpatient basis and
you are not given any medicine
to make you drowsy. Your X-ray
technician will apply a special gel
to your skin on your chest and

stomach and move an X-ray tube over your body. The medical X-ray technician will also apply a special gel to your skin and move the X-ray tube over the surface of the area you are being examined.

You can be examined while you are in a semiprecious stone cabinet or in a machine similar to a dentist's chair. You may be able to watch a movie in the room, or you may be in a big room that is quiet. This will give you a better feeling of not being alone. When the X-ray technician finishes, you will be shown your X-ray images

on a monitor. The medical X-ray technician may ask you if anything is wrong or if anything looks different. You will usually feel no pain during the procedure. In some cases, you may be given medicine that will make you sleepy so that you do not feel pain. The purpose of the CT-scan is to take a “snap shot” of the inside of your body. An X-ray may not be enough. A CT-scan can show if something is hidden that would not be seen on a standard X-ray. Why is an X-ray different from a CT-scan?

Although a CT-scan is called a computerized tomography because of the way it uses a computer, it is not a computerized X-ray. Instead, a special machine called an X-ray CT is used. It is a machine that lets radiation pass through your body, then it measures the amount of X-rays that pass through your body. The machine can measure different qualities of X-rays, including the intensity and duration of the X-rays. A CT-scan is more accurate than an X-ray because it is able to see very

small details in the bones and tissue. It is also able to see what's called soft tissue where a normal X c6a93da74d
