Electric utility company A power utility company owns equipment such as electrical substations and transmission lines that supply electric power to a community and the equipment is located at a substation or on the transmission line. A substation is a distribution center where electricity is stepped up from the level of the transmission company to the level of an electric utility company. The larger the load that a substation is serving, the more equipment is usually needed, like transformers, switchgear and metering equipment. The substation is used to step up a low voltage alternating current to an intermediate voltage alternating current, which is then distributed to customers. There are three typical functions of a substation:

Stepping up from the transmission line to the distribution feeder Distribution of electric power from the distribution feeder to the customers. Tracing out and interconnecting distribution and branch circuits. The layout of a substation is similar to that of a large mechanical or electrical factory. There are usually several buildings within the substation, including a gantry building containing the equipment and a control room. Outside, there are often several transformers connected to the transmission lines or other installations. Distribution feeders, switchgear and control equipment are inside the building. After a transmission line is established and its capacity needs assessed, the substation is built to service the line. In general, there is a main transformer and a number of distribution transformers feeding the customer distribution feeder circuits. Some larger substations have one or more shunt reactors to limit the voltage of the transmission system. Some substations are equipped with an underground vault. The substation is the major equipment of an electric utility company, and the maximum size of substation is usually defined by the distance between the places where a substation is required. An electric utility company usually has many substations and the distance between the substations is much shorter than the distance between a generating station and a substation. A substation may also be used to connect two transmission lines so that the voltage is stepped up from one to the other. The
