Apple Pencil support means you can easily navigate photos, illustrations, and other projects by hand and use other tools, like erasers, brushes, and color wheels, more easily than with a mouse or trackpad. Of course, there is a Mac version, too, although the studio notes Photoshop doesn't come as an app any more, so it's entirely possible you turn to Adobe's software only to find it isn't there. Who does? In the latest instalment of the company's 'State of In-Store' ( Sarah Thomas blog post ), which looks at competing payment methods, the UK's retailer "Tesco" is said to be using Paypal and is said to be supporting Apple Pay as well. Paypal has locked horns with both Apple Pay and contactless payment methods from banks and retailers this year. Earlier this month, the company said that it intended to introduce a "reimagined" version of its digital wallet "Digital Goods" — which acts as a replacement for the app — this April. Therefore, it comes as no surprise that Adobe allows every user to install Lightroom on their Leopard computer, despite Lightroom's own security measures preventing this. However, there is a catch. In order to propagate Adobe's proprietary system, anything Lightroom does must depend on every other part of the entire suite. If someone wanted to install Photoshop only, they would not be able to update or run the "contact us" feature, for example. (This is a design choice; it can be argued either way.) So, what was the catch. If the Lightroom box is closed, Lightroom will abruptly exit. That's fairly convenient, as you can rest assured that you'll be able to open the app again the next time you want to use it. But if the Lightroom box is open, there's a new problem. Lightroom knows only one thing: a new version is available. It can't even tell you that it is about to close, nor that it's about to open. Because two apps running could possibly use the same data, Lightroom has to disconnect from the Internet to make sure it's safe from errant Copy & Paste actions. That means, if you're online - every single time. As anyone who uses Photoshop knows, having to interrupt what you're doing in a big way is an annoyance. It's a constant nuisance that's required for updates.

It's a great tool for building your own online portfolio, and professional designers all around the world use designs they've created to stand out in the crowd. But designing a logo isn't as straightforward as it seems. From choosing the right typeface and font to creating a clear, legible design. Rather than just a simple bit of text, a logo is a single design element that's repeated on more than one occasion. That means it's important to test the branding, layout, colour scheme and related graphics your logo will create to make sure it's as effective for your clients as it is for yourself. Regardless of the medium your logo will be used on - display or print - its visual appeal is pivotal to the way it's received. Logo design software has come a long way in the past few years and makes it easy to sort through the clutter of various logo designs on the web. But simple is often better. You should think about how you'd expect to see your logo reproduced out of the box, and then work it into your design.
